

GROUP 6: AI Usage Log

1. AI Tool(s) Used

- ChatGPT

2. Purpose of Use

Generative AI was used as a learning support tool during the development of the Android application. The main purposes were

- Understanding Kotlin and Android Studio concepts
- Learning and clarifying Jetpack Compose components
- Debugging errors encountered during development
- Understanding programming concepts and existing code
- Improving code readability and structure
- Getting suggestions for simple and user-friendly UI designs

AI assistance was used when clarification or troubleshooting was needed rather than as a replacement for the group's development work.

3. Representative Prompts

Examples of prompts used during development include:

- "Explain how this Kotlin code works."
- "Why am I getting this error in Android Studio?"
- "How can I fix this Jetpack Compose error?"
- "How can I validate user input in this form?"
- "How can I improve the layout of this screen?"
- "Can you explain this Android Studio project structure?"

4. AI-Generated Suggestions Adopted or Rejected

The group reviewed AI-generated suggestions before applying them. Useful suggestions related to debugging, code structure, input validation, and UI design were adopted where appropriate. Suggestions that were unnecessary, unsuitable for the project requirements, or did not work correctly were rejected or modified.

5. Modifications Made by our group

AI suggestions and code examples were adapted to the group's existing project. We made changes to:

- Match the existing project structure
- Adjust UI layouts and components
- Modify code to meet the application's requirements
- Adjust validation and input handling
- Fix issues discovered during testing
- Remove unnecessary suggestions or features

All implemented changes were tested in Android Studio before being included in the final application.

6. Reflection

Generative AI supported us mainly by helping to understand unfamiliar Android concepts and troubleshoot development problems. It was useful for explaining errors and providing possible approaches when we were unsure how to proceed.

We did not rely on AI to make all development decisions. Suggestions were reviewed, adapted, tested, and changed according to the application's requirements. Through this process, the group gained a better understanding of the implementation and was able to solve development issues more efficiently.

We remain responsible for the correctness, quality, testing, and understanding of the submitted application and are prepared to explain the implementation during the project demonstration and technical viva.
